

Bridging the gap between theory and practice

"By practising rare situations as well, nurses build the confidence to act faster and more decisively in clinical practice."

Ward supervisor, Van Weel-Bethesda

We prepare healthcare professionals in training for clinical practice in a safe and realistic learning environment.

- **Lifelike clinical exposure** — XR scenarios bring theory closer to the realities of caring for acutely ill patients.
- **Mastery of the ABCDE approach** — By practicing repeatedly in lifelike scenarios, systematic assessment becomes second nature.
- **Preparedness** — Students are better prepared for urgent situations in clinical practice.

TrueSim offers mixed reality simulation training that enables healthcare students and professionals to practise the ABCDE approach in realistic scenarios, in their own workplace and whenever it suits them.

Confident action in acute situations

With TrueSim, healthcare professionals (in training) develop:

- **Mastery of the ABCDE structure** — Systematically recognizing and treating acute clinical deterioration.
- **SBAR(R) communication** — Delivering clear, structured and consistent handovers.
- **Effective teamwork under pressure** — Clear roles, effective communication and a structured approach.

Training for the moments that matter

24 validated scenarios for ABCDE training and SBAR handovers, divided into three categories:

- **Respiration** — Pneumonia, pulmonary embolism, anaphylaxis, pneumothorax, cardiac asthma.
- **Circulation** — Sepsis, myocardial infarction, hypovolemic shock.
- **Central nervous system** — CVA, hypoglycemia, intoxication.

Our platform is available through a licence per headset and provides everything needed to embed this form of training sustainably within your organization.

Alongside the technology, we provide clinical and strategic expertise to support successful implementation in education and healthcare.
